Coin Payment

Problem

Suppose you have an unlimited supply of coins with values 2, 3, and 5 cents

How many ways can you pay for an item costing 12 cents?

Coin Payment

What if the order ...

... **matters?**

... **does not matter?**

Recurrence Relation: Break down into smaller problems

Memoization: Remember what you already calculated

Roadmap

Recurrence Relation

Continuous Optimization

Probability Theory

Python

Matrix Calculus

$$f(\mathbf{w}) = (\mathbf{a} \cdot \mathbf{w} + 1)^2 + b \|\mathbf{w}\|_2^2 + \mathbf{w}^\top C \mathbf{w}$$

Compute $\nabla_{\mathbf{w}} f(\mathbf{w})$

$$\nabla_{\mathbf{w}} \mathbf{a} \cdot \mathbf{w} = \mathbf{a}$$

$$\nabla_{\mathbf{w}} \|\mathbf{w}\|_2^2 = \nabla_{\mathbf{w}} \mathbf{w} \cdot \mathbf{w} = 2\mathbf{w}$$

$$\nabla_{\mathbf{w}} \mathbf{w}^\top C \mathbf{w} = (C + C^\top) \mathbf{w}$$

Multiclass Classification

Let's review **binary classification**

Score:

$$\text{score}_{+1}(x, \mathbf{w}) = \mathbf{w} \cdot \phi(x)$$

$$\text{score}_{-1}(x, \mathbf{w}) = (-\mathbf{w}) \cdot \phi(x)$$

Prediction:

$$f_{\mathbf{w}}(x) = \begin{cases} +1 & \text{if } \text{score}_{+1}(x, \mathbf{w}) > \text{score}_{-1}(x, \mathbf{w}) \\ -1 & \text{otherwise} \end{cases}$$

$$f_{\mathbf{w}}(x) = \arg \max_{y \in \{-1, +1\}} \text{score}_y(x, \mathbf{w})$$

Multiclass Classification

Problem

Suppose we have 3 possible labels $y \in \{\text{R}, \text{G}, \text{B}\}$

Weight vectors: $\mathbf{w} = \{\mathbf{w}_{\text{R}}, \mathbf{w}_{\text{G}}, \mathbf{w}_{\text{B}}\}$

Scores: $[\mathbf{w}_{\text{R}} \cdot \phi(x)], [\mathbf{w}_{\text{G}} \cdot \phi(x)], [\mathbf{w}_{\text{B}} \cdot \phi(x)]$

Prediction: $\hat{y} = f_{\mathbf{w}}(x) = \arg \max_{y \in \{\text{R}, \text{G}, \text{B}\}} [\mathbf{w}_y \cdot \phi(x)]$

Multiclass Classification

How to learn \mathbf{w} ?

How about **0-1 loss**:

$$\text{Loss}_{0-1}(x, y, \mathbf{w}) = \begin{cases} 1 & \text{if } \hat{y} \neq y \\ 0 & \text{otherwise} \end{cases}$$

Problem: Gradient is 0 almost everywhere

Multiclass Classification

How to learn \mathbf{w} ?

Recall **hinge loss**:

$$\text{margin} = \text{score}_y(x, \mathbf{w}) - \max_{y' \neq y} \text{score}_{y'}(x, \mathbf{w})$$

$$\text{Loss}_{\text{Hinge}}(x, y, \mathbf{w}) = \max\{1 - \text{margin}, 0\}$$

What is the gradient?

Recurrence Relation

Continuous Optimization

Probability Theory

Python

Random Variables

Discrete:

$$\mathbb{P}(A = a) \quad \text{or} \quad p_A(a)$$

Continuous:

~~$$\mathbb{P}(A = a)$$~~

$$f_A(a)$$

$$\mathbb{P}(A \leq c) = \int_{--}^c f_A(a) da$$

Spinning Wheels

| | $A = 0$ | $A = 1$ | $A = 2$ | $A = 3$ |
|---------|---------|---------|---------|---------|
| $B = 0$ | 0.1 | 0.25 | 0.1 | 0.05 |
| $B = 1$ | 0.15 | 0 | 0.15 | 0.2 |

- What is $\mathbb{P}(A = 2)$
- What is $\mathbb{P}(A = 2 \mid B = 1)$

Random Variables

Independence:

$$\mathbb{P}(A = a, B = b) = \mathbb{P}(A = a)\mathbb{P}(B = b)$$

$$f_{A,B}(a, b) = f_A(a)f_B(b)$$

Expectation:

$$\mathbb{E}[A] = \sum_a a \mathbb{P}[A = a]$$

$$\mathbb{E}[A] = \int a f_A(a) da$$

Spinning Wheels

| | $A = 0$ | $A = 1$ | $A = 2$ | $A = 3$ |
|---------|---------|---------|---------|---------|
| $B = 0$ | 0.1 | 0.25 | 0.1 | 0.05 |
| $B = 1$ | 0.15 | 0 | 0.15 | 0.2 |

- Are A and B independent?
- What are $\mathbb{E}[A]$, $\mathbb{E}[B]$, $\mathbb{E}[A + B]$

Linearity of Expectation: $\mathbb{E}[A + B] = \mathbb{E}[A] + \mathbb{E}[B]$

True even when A and B are dependent!

Random Variables

Variance:

$$\text{Var}[A] = \mathbb{E}[(A - \mathbb{E}[A])^2] = \mathbb{E}[A^2] - \mathbb{E}[A]^2$$

Covariance:

$$\begin{aligned}\text{Cov}[A, B] &= \mathbb{E}[(A - \mathbb{E}[A])(B - \mathbb{E}[B])] \\ &= \mathbb{E}[AB] - \mathbb{E}[A]\mathbb{E}[B]\end{aligned}$$

If $\text{Cov}[A, B] = 0$, we say A and B are **uncorrelated**

Random Variables

If A and B are independent, then

- $\text{Cov}[A, B] = \mathbb{E}[AB] - \mathbb{E}[A]\mathbb{E}[B] = 0$

Independence implies uncorrelatedness

- $\text{Var}[A + B] = \text{Var}[A] + \text{Var}[B]$

Noise adds up

But the converse is **not** true!

Roadmap

Recurrence Relation

Continuous Optimization

Probability Theory

Python

Syntactic Sugar

- List comprehension
- List slicing
- Generator
- Passing functions
- Reading and writing files

Gotchas

- Integer division
- Tied objects
- Global variables
